Hinges Y Position Editing User Guide.

Introduction

Overview

- The 'Hinges Y Position Editing Package' from Solid Setup Plus adds the ability to move hinges up or down **individually** on a door.
- Displays the hinge center position as an **attribute** on the door for each hinge, which can be edited.
- Is written to work on a left or right hinged door only.
- Standard hinge position overrides for the bottom and top hinge in the cabinets section view are unaffected
- Works **independently** of our other hinge packages.
- To move a left or right refer to our **HNGXPOS** (Hinges X Position Editing) package.
- To move the hinge plate left to right refer to our **HNGPTX** (Hinge Plate X position edit) package

Included in This Package

User Created Standards

The Following UCS is provided:

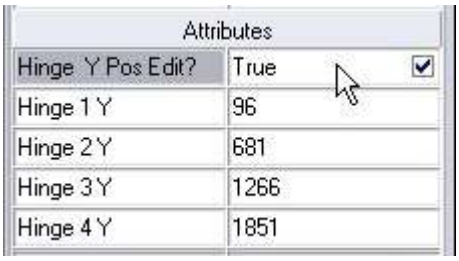

{ HINGES } – Edit Y Pos

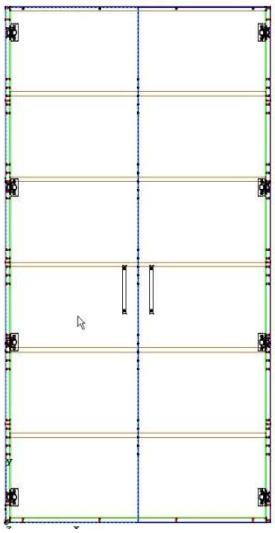

Once installed, ensure that this UCS appears above any other hinge UCS's you may already have. If you also have our **"{ HINGES } – Edit X Pos"** UCS (**HNGXPOS**) or our **"{ HINGES } -- Adjust Plate X Pos"** UCS (**HNGPTX**), they should all be above any other hinge UCS's you may have, including our **BLMCTOP** (Blum Cliptop Hinge Visual) package etc.
Refer to our website for more information on UCS order.

Usage

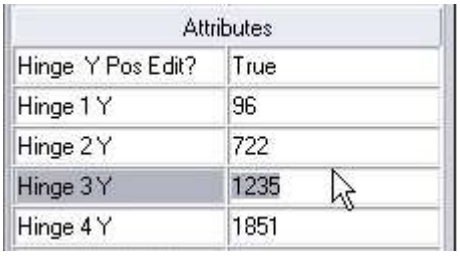

Attributes

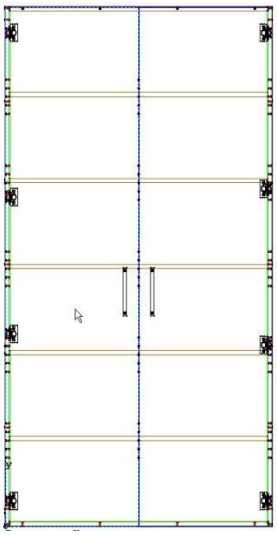

- To move the hinges up or down click on the door in the orthographic front view in the cabinet editor
- Tick **"Hinge Y Pos Edit?"** under the Attributes heading on the left side of the screen

- The Y position of each hinge is then displayed as an attribute.
- The value is the distance from the **bottom** of the door to the **centre** of each hinge.
- Change the value for the hinges you want to move.

- If you change your mind, unticking the **"Hinge Y Pos Edit?"** attribute will return the hinges to their original position.

Hinges Y Position Package Revision List.
